

Github Use and Learning

Sidi Liu, Jiayin Wang, Frank Fu

When writing our Police and Burglar project, we actively used Github to share our codes and review others progress. Github provides us the ability to vividly present our solution within the team. In particular, we connect our java terminal to github, and thus we can simply retrieve and update our codes from the version control system. Moreover, every time we made an update to our java file, github repositories record the timestamp it was updated. As a result, we can easily track who made the latest modification. Another important feature we found really useful about github was that it was an open community source where many computer professionals publish their projects and findings to it. As we frequently encountered errors during coding, we could search on Github and looked at how others deal with the same errors. Hence, github is an additional learning tool that can help us approach the problems at multiple perspectives.
